KITTEN PLAN

**College Village Animal
Clinic**

907-274-5623

Congratulations on the addition of a new kitten to your family. The doctors and staff at College Village Animal Clinic are excited to help you provide the best care possible for your new family member. We have developed our kitten plan to include all the necessary exams, vaccinations, deworming, and lab tests needed to get your kitten started on a long and healthy life.

At each visit, the doctor will perform a complete physical exam to evaluate your kitten for any signs of illness. They will also cover many different topics for discussion including training, nutrition, oral care, and spay/neuter. These visits are a great opportunity for you and your kitten to get to know the doctors and staff of College Village Animal Clinic. If you have any questions this is also an excellent time to ask the doctor or technician.

Vaccines

FVRCP

This is a combination vaccine containing feline viral rhinotracheitis, calicivirus, and panleukopenia. . These are different viruses that cause respiratory and intestinal disease. They are all quite contagious and difficult to treat.

FeLV

This is a vaccine for the feline leukemia virus. FeLV is the most common cause of cancer in cats, it may cause various blood disorders, and it may lead to a state of immune deficiency that hinders the cat's ability to protect itself against other infections.

Rabies

This is a prevention for the rabies virus. Rabies is a fatal virus that affects the nervous system. It is spread to people and animals by bites from infected animals. Rabies is nearly untreatable once symptoms begin and vaccination is required by law.

Deworming

At each visit we will give your kitten an oral dewormer. It may be a liquid or a pill. This medication will treat any parasite infection we diagnose through the fecal exam and help prevent infection in between visits.

FeLV/FIV Test

This is a blood test screening for the feline leukemia virus and feline immunodeficiency virus. Kittens and cats infected with these viruses often do not live past 3-5 years old. Neither virus is treatable and they are very contagious to other cats in the house.

Lab Tests

Fecal Exam

This tests for intestinal parasites. Kittens can acquire intestinal worms from their mother before being born or through the milk. They can also get intestinal parasites through parasite eggs in the feces of other animals. Many of the worms kittens get are transmissible to humans and can cause serious disease. We perform this test in the clinic through a centrifugation process. This process allows us better evaluation and identification of parasite eggs in the feces. If parasites are seen, we can prescribe the proper deworming medication.

Blood Panel

At the final visit, we will draw a blood sample to be sent to an outside lab. This test includes a complete blood count and a small number of chemistries. The complete blood count will help the doctor determine if the kitten is anemic (low red blood cell count) or has an infection (high white blood cell count). The chemistries will help the doctor evaluate the kitten's liver and kidney function. Changes in these values may be indicative of a congenital defect or problem that needs to be treated. If you plan to spay or neuter your kitten, this blood test is a great pre-op screen before anesthesia.
